Moisture and Ash Determination in Flour

LECO Corporation; Saint Joseph, Michigan USA

Introduction

An accurate determination of moisture and ash content in flour products provides important information related to the food quality and safety (texture, taste, microbial stability). Moisture is also a key variable used to calculate a products purity, yield, and/or resulting constituent analysis on a dry basis. Ash content is also an indicator of contaminants such as bran in refined flours. The LECO TGA801 is a macro thermogravimetric analyzer that allows up to 19 samples to be analyzed simultaneously.

Sample Preparation

A representative, uniform sample is required
