Inductively Coupled Plasma Mass Spectrometer

Determination of Additive and Trace Elements in Lubricating Oil Using ICP-MS

Kosuke Naka

User Benefits

- ◆ Metal elements in lubricating oil can be accurately analyzed by dilution with organic solvents.
- ◆ Solvent-resistant peristaltic pump tubing enables the addition of internal standard elements in-line, even for organic solvent analysis, thereby eliminating the need for manual addition.

■ Introduction

Organic metal compounds are added to lubricating oil to provide various functional properties. Therefore, monitoring the concentrations of these additives is important for ensuring quality control. In addition, the analysis of wear metals and contaminant metals in lubricating oils (engine oils) used in automobiles and ships is a crucial method for assessing the condition of the engine. Traditionally, these analyses have utilized ICP Optical Emission Spectrometry (ICP-OES) as outlined in ASTM D4951-14¹⁾ and ASTM D5185-18²⁾. However, for the analysis of trace metal elements that are difficult to detect with ICP-OES, the more sensitive ICP mass spectrometry (ICP-MS) is more suitable.

In this Application News, lubricating oil was diluted with organic solvents, and the additives and trace elements in the oil were analyzed using the ICP-MS 2050 (Fig. 1). To verify the accuracy of the analytical results, spike recoveries were also evaluated.

Fig. 1 ICPMS-2050 and AS-20

■ Samples and Reagents

• Samples

Commercially available automotive engine oil (mineral oil) was used.

• Diluent

PremiSolv (CONOSTAN) was used.

• Reagents for standards

The oil-based mixed standard solution S-21 and the oil-based single-element standard solutions for Li, P, K, Co, Sb, Be, Y, In, and Bi (CONOSTAN), and the oil-based single-element standard solution for S, Sc (LGC Standards) were used.

■ Preparation of Samples and Standards

• Sample Preparation (for Trace Element Analysis)

Samples were diluted 50-fold (w/w) with PremiSolv to prepare them for analysis of trace elements. Spiked samples were prepared similarly, with one solution containing trace elements excluding sulfur (S), and another solution containing only S.

• Sample Preparation (for Additive Element Analysis)

The sample was diluted 5000-fold (w/w) with PremiSolv to prepare a sample solution for analysis of the additive elements.

• Calibration standards

S-21 and single-element standard solutions were mixed and diluted with PremiSolv to prepare the calibration standards. The concentrations of each element in the calibration standards are shown in Table 1.

• Internal standard solution

Oil-based single-element standard solutions of Be, Sc, Y, In, and Bi were mixed and diluted with PremiSolv. The concentrations of Be and Sc in the internal standard solution are 1000 µg/kg, while the concentrations of Y and In are 100 µg/kg, and Bi is 20 µg/kg.

■ Configurations and Analytical Conditions

Table 2 shows the configuration of the ICP-MS. The "Organic Solvent Injection System" was used as the sample introduction system. By using a platinum sampling cone, damage to the cone from prolonged exposure to organic solvents can be minimized. Additionally, the use of solvent-resistant peristaltic pump tubing enables the in-line addition of internal standard elements, thereby streamlining the sample preparation process.

Table 3 shows the analytical conditions. To prevent the precipitation of carbon from the organic solvent in the interface, a mixed gas of argon (70 %) and oxygen (30 %) was introduced into the quadrupole structure organic solvent torch. To reduce the effects of non-spectral interferences, such as ionization interference from highly concentrated additive elements in lubricating oil, dilution gas was introduced.

Table 1 Concentrations of Analytes in Calibration Standards

Elements	Calibration Standards (µg/kg)						
	STD0	STD1	STD2	STD3	STD4	STD5	STD6
Li, Na, Al, K, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Cd, Sn, Sb, Pb	0	10	50	200			
B, Mg, Si, Ca, Zn, Mo	0		50	200			
P	0	1,000	5,000	20,000			
S	0				10,000	50,000	100,000

Table 2 ICP-MS System Configuration

Instrument	: ICPMS-2050
Nebulizer	: Nebulizer DC04
Chamber	: Cyclone Chamber

Cell Gas	: He
Cell Gas Flowrate (mL/min)	: -
Cell Voltage (V)	: -
Energy Filter (V)	: -

Detection Limit

The instrument detection limits (IDLs) are shown in Table 4. The IDLs were calculated as the concentration that gives a signal equivalent to three times the standard deviation (σ) of the calibration blank sample (STD0).

Quantitative Analysis and Spike Recoveries

The trace metal elements in engine oil were quantitatively analyzed using the calibration standards shown in Table 1. The quantitative results were converted to the concentrations in engine oil by multiplying the dilution factors (trace elements: 49.89 times, additive elements: 4960 times). Additionally, to confirm the accuracy of the measurement, spike recoveries were evaluated. Table 5 shows the results of the quantitative analysis and the spike recoveries.

Good recoveries, ranging from 88 % to 116 %, were obtained, confirming that the influence of the inorganic matrix derived from the additive elements was sufficiently minimized. These results indicate that trace metal elements in engine oil can be accurately analyzed using only dilution with organic solvents.

Conclusion

In this Application News, the analysis of metal elements in lubricating oil was performed using the ICPMS-2050 with the organic solvent injection system. Good spike recoveries were achieved, confirming that trace metal elements in lubricating oil can be accurately quantified with a simple sample preparation involving only dilution with organic solvents. Since it is possible to analyze without the complex procedures required for acid decomposition, the risk of volatilization or contamination of the analytes during the sample preparation process is reduced. Additionally, the use of solvent-resistant peristaltic pump tubing enables the in-line addition of internal standard elements, further reducing the time required for sample preparation.

Table 4 Detection Limits (DLs)

Elements	Cell Condition	Internal Standards	IDLs (μg/kg)
⁷ Li	No Gas	⁹ Be	0.1
¹⁰ B	No Gas	⁹ Be	0.4
²³ Na	No Gas	⁴⁵ Sc	0.7
²⁴ Mg	H ₂ -A	⁴⁵ Sc	1
²⁷ Al	He	⁴⁵ Sc	0.6
²⁸ Si	H ₂ -A	⁴⁵ Sc	4
³¹ P	He	⁴⁵ Sc	40
³⁴ S	H ₂ -B	⁴⁵ Sc	1,000
³⁹ K	H ₂ -A	⁴⁵ Sc	0.8
⁴⁴ Ca	H ₂ -A	⁴⁵ Sc	2
⁴⁹ Ti	He	⁴⁵ Sc	0.9
⁵¹ V	H ₂ -A	⁴⁵ Sc	0.03
⁵² Cr	H ₂ -A	⁴⁵ Sc	0.03
⁵⁵ Mn	H ₂ -A	⁴⁵ Sc	0.04
⁵⁶ Fe	H ₂ -A	⁴⁵ Sc	0.2
⁵⁹ Co	He	⁴⁵ Sc	0.03
⁶⁰ Ni	He	⁴⁵ Sc	0.3
⁶³ Cu*	He	⁴⁵ Sc	0.2
⁶⁶ Zn	He	⁴⁵ Sc	0.7
⁹⁵ Mo	He	⁸⁹ Y	0.03
¹¹¹ Cd	H ₂ -B	¹¹⁵ In	0.05
¹¹⁸ Sn	He	¹¹⁵ In	0.06
¹²¹ Sb	He	¹¹⁵ In	0.02
¹³⁸ Ba	He	¹¹⁵ In	0.03
²⁰⁸ Pb	He	²⁰⁹ Bi	0.05

IDL (Instrument Detection Limit): 3σ (standard deviation of STD0) \times slope of calibration curve

*: In case that a large amount of Zn is contained, Cu may be affected by the peak tailing from Zn. To avoid peak tailing, Cu is measured in high resolution mode with double the standard resolution.
