# Pesticide Residues Analysis by Clarus 690 Gas Chromatograph and SQ 8 Mass Spectrometer

## Introduction

Pesticide residues are commonly found on many different food products and may have harmful effects

on humans, animals and the environment. Therefore, many countries have set limits on acceptable levels pesticide residues on foods and feed to prevent such harmful effects from occurring. Gas chromatography/mass spectrometry (GC/MS) methods are the traditional analytical method for pesticide residues and are widely used because of the sensitivity and selectivity offered. To determine low levels of pesticides, an inert injector is needed to offer lower reactivity to labile compounds to get excellent sensitivity and repeatability. A new capillary split/splitless injector for the PerkinElmer Clarus® 690 GC is designed with electro-polished inside surfaces, a gold seal and optimized internal geometry all of which reduce the chance of the analytes of interest interacting with reactive sites and decomposing.

In this study, various residual pesticides were analyzed by a PerkinElmer Clarus 690 GC combined with a PerkinElmer Clarus SQ 8 MS. The results of method detected limit (MDL) and repeatability are excellent. This system is highly sensitive and repeatable for the analysis of pesticide residues.

## Experimental Details

A PerkinElmer Clarus 690 GC was connected to a PerkinElmer Clarus SQ 8 MS in electron ionization (EI) mode to perform these experiments with the conditions presented in Table 1, Table 2 and Table 3 for four groups of pesticide mixtures (Tables 4 to 7). An ultra deactivated single taper inlet liner with wool for split/splitless inlets (Part No. N6502035) combined with a pulse splitless injection function was used for low level of pesticide residues determination in this study.

A PerkinElmer Elite 5MS column (30 m x 0.25 mm x 0.25  $\mu$ m) and a PerkinElmer Elite 1701 column (30 m x 0.25 mm x 0.25  $\mu$ m) were used to separate the target compounds.

Group 1 and 4 calibration standards were purchased from ANPEL Laboratory Technologies (Shanghai) Inc. Group 2 and 3 calibration standards were provided by a private laboratory. Group 1 standards were diluted with n-hexane (HPLC grade, Honeywell), group 2 and 3 standards were diluted with n-hexane/acetone (1:1, V/V) and group 4 standards were diluted with acetone (HPLC grade, Merck) to produce the required concentration of the calibration solutions (shown in Tables 4 to 7).

Method precision was investigated with six injections of the level 1 standard. Method detection limits were determined by analyzing seven replicates of the level 2 standard.

Table 1. Analytical parameters for the group 1 pesticides.

| GC Parameters             |  |       |           |
|---------------------------|--|-------|-----------|
| Injector Type             | Capillary injector with capillary split/splitless ultra deactivated single taper inlet liner with wool |       |           |
| Analytical Column         | Elite-5MS (30 m x 0.25 mm x 0.25 $\mu$ m)  |       |           |
| Inlet Temp                | 280 °C   |       |           |
| Injection Volume          | 1 $\mu$ L  |       |           |
| Initial Oven Temp         | 50 °C  |       |           |
| Oven Hold                 | 1.0 min  |       |           |

## Results and Discussion

The total ion chromatograms of the level 1 calibration standards are shown in Figures 1 through 4. All target compounds were quantified using selected ion scanning mode. Tables 8 to 11 summarizes the results for retention time, quantitative and qualitative ion, precision, method detection limits (MDLs) and

quantitation limits (MQLs). The precision data (RSD %) are in the range of 0.44 – 3.64% for the replicates of the level 1 standard sample; the MDLs per sample were calculated for most target compounds to be in the range of 0.08 – 10.73 ng/mL because of their different chemical properties.

Table 8. Results for retention time, precision, MDL and MQL for the group 1 pesticides mixture.

| No. | Compound Name      | RT                         | RSD% | MDL/ppb | MQL/ppb |
|-----|--------------------|----------------------------|------|---------|---------|
| 1   | Bifenthrin         | 20.79                      | 0.87 | 3.40    | 13.60   |
| 2   | Fenpropathrin      | 21.07                      | 1.89 | 4.40    | 17.60   |
| 3   | Lambda Cyhalothrin | 22.36                      | 1.17 | 4.19    | 16.76   |
| 4   | Baythriod          | 24.24, 24.64, 24.74, 24.81 | 2.92 | 9.62    | 38.48   |
| 5   | Cypermethrin       | 25.00, 25.16, 25.25, 25.32 | 2.34 | 9.81    | 39.24   |
| 6   | Fenvalerate        | 26.41, 26.73               | 2.75 | 4.02    | 16.08   |
| 7   | Deltamethrin       | 29.06                      | 2.91 | 3.23    | 12.92   |

Table 9. Results for retention time, precision, MDL and MQL for the group 2 pesticides mixture.

| No. | Compound Name  | RT           | RSD% | MDL/ppb | MQL/ppb |
|-----|----------------|--------------|------|---------|---------|

## Summary

In this study, the method detection limits (MDLs) and quantitation limits (MQLs) for various pesticide residues were determined using a PerkinElmer Clarus 690 GC combined with a PerkinElmer Clarus SQ 8 MS. The excellent sensitivity and repeatability for the pesticides demonstrates the new capillary split/splitless injector's good chemical inertness to labile compounds and satisfies the inertness required for pesticide residue determination.
